

Mock Demonstration Evaluation – DP-900 (Niharika)

17 March 2026 04:12 PM

Mock Demonstration Evaluation – DP-900 (Niharika)

1. Opening & Initial Control

You began with:

“Are you able to see my screen?”

That is acceptable, but the session opening lacked authority framing. There was no context-setting statement.

A stronger opening would be:

“Good morning. Today we’ll be covering the fundamentals of relational data in Azure as part of DP-900. By the end of this module, you’ll understand relational concepts, normalization, SQL fundamentals, and how Azure supports relational services.”

That immediately signals structure and ownership.

You frequently used:

- “Moving to the next slide.”
- “Now moving to the next slide.”
- “We will going to...”

This creates repetitive slide-driven narration rather than concept-driven delivery.

Instead of slide navigation commentary, use logical transitions:

“Now that we understand relational tables, let’s move to normalization — which addresses data redundancy.”

This improves structural flow and maturity.

2. Language & Verbal Precision

Observations

- Repetitive phrasing
- Minor grammatical instability (“we will going to”)
- Frequent use of “okay” as filler
- Limited variation in delivery tone

While understandable, it gives early-stage trainer energy.

For example:

You defined relational tables as:

“Data which are stored in a tabular format having rows and column and the tables must having some kind of relation...”

This needs tightening.

Stronger version:

“A relational table stores structured data in rows and columns, and relationships are established between tables using keys.”

Precise language builds credibility.

3. Conceptual Depth & Accuracy

Relational Tables

Your explanation was directionally correct but word-heavy and not structured.

Better structured explanation:

“Relational databases store data in tables. Each table represents an entity. Relationships between entities are defined using primary and foreign keys.”

Concise. Structured. Controlled.

4. Normalization – Major Gap

When asked about types of normalization, you responded:

“There are basically 3 types... we can learn it from Google...”

This is a serious red flag.

A trainer must never redirect learners to external sources during live delivery.

Even if the slide does not include it, your response should reflect awareness.

Correct approach:

“There are five normal forms in theory. In practice, for DP-900, we focus mainly on 1NF, 2NF, and 3NF. Beyond that, higher normal forms are more common in advanced database design scenarios.”

That would demonstrate awareness without overteaching.

Saying “we can Google it” weakens authority significantly.

This was the most critical weakness in the session.

5. Primary Key & Foreign Key

When re-explaining foreign key, the definition became circular:

“Foreign key builds relationship with primary key...”

It needed structural clarity.

Better explanation:

“A primary key uniquely identifies each row in a table. A foreign key is a column in one table that references the primary key of another table to establish a relationship.”

Also, this was an opportunity to draw the relationship visually. No annotation or zooming was used.

That reduced engagement.

6. SQL Explanation

When asked why SQL is called Structured Query Language, your answer was strong:

“Because it deals with structured data.”

However, you stopped there.

You could have strengthened it:

“It’s called structured because queries must follow a defined syntax. If the structure is incorrect, the database engine will not execute the command.”

That extra depth differentiates trainers.

7. DDL, DML, DCL – Minor Technical Slip

You said:

DCL stands for Data Definition Language.

That is incorrect.

DCL = Data Control Language.

This is a conceptual stability issue.

In foundational courses like DP-900, terminology accuracy is critical.

8. Views – Technical Inaccuracy

You said:

“View creates a customized table.”

This is incorrect.

A view does not create a table.

Correct explanation:

“A view is a virtual table. It does not store data physically. It presents data from one or more tables based on a defined query.”

Terminology matters heavily in database fundamentals.

9. Index Explanation

You described index as:

“First page of the book.”

This is inaccurate.

Correct analogy:

“An index works like the table of contents in a book. Instead of scanning every page, the database engine uses indexes to quickly locate rows.”

Small wording differences change perceived technical maturity.

10. Lab Demonstration – Strong Section

This was your strongest area.

Positives:

- Lab preloaded
- Clear instruction referencing
- Good prerequisite explanation
- Logical step-by-step navigation
- No hesitation in portal flow

You handled Azure SQL creation well.

However, improvements needed:

- When Azure portal first loaded, you did not give an overview of the portal.
- When selecting SQL authentication, you relied on instructions rather than reasoning.

When asked “Why SQL authentication?” — your answer referenced instructions instead of conceptual justification.

Better answer:

“For lab environments, SQL authentication is simpler because it does not depend on Azure AD identity configuration.”

That demonstrates understanding.

11. Eye Movement & Confidence Signals

Multiple times, you looked away from the screen while speaking.

This creates perception of:

- Searching for answer
- Lack of preparation
- Reduced confidence

If notes are required, use a second screen.

External scanning during explanation reduces executive presence.

12. Engagement & Classroom Intelligence

You rarely:

- Asked reflective questions
- Checked learner understanding
- Used relatable business examples

DP-900 may be fundamentals, but audience engagement still matters.

For example:

While explaining normalization:

“Imagine storing customer address repeatedly in every order row — what happens if the address changes?”

This type of question anchors learning.

13. Long-Term Trainer Potential

Strength Indicators

- Calm delivery
- No panic during questioning
- Lab handling is structured
- Improved compared to last mock

Risk Indicators

- Occasional conceptual inaccuracy

- External resource referencing
- Slide-driven narration
- Limited enterprise framing
- Moderate language instability

You are improving. That is clear.

But now the transition required is:

From explaining content

To owning the topic.

1) Structured Feedback Summary

Strengths

- Better than previous mock
- Lab flow well handled
- Calm under questioning
- Logical topic progression
- Strong effort visible

Weaknesses

- Normalization knowledge incomplete
- DCL terminology error
- View definition imprecise
- External resource redirection
- Slide repetition habit
- Limited real-world examples

Delivery Habits

- Repetitive transitions
- Filler usage
- Limited vocal variation
- No visual annotation

Technical Gaps

- Weak awareness of higher normal forms
- Incomplete control over SQL terminology
- Minor conceptual inaccuracies

Behavioural Observations

- Coachable
- Not defensive
- Needs stronger authority tone
- Needs deeper preparation notes

2) Remarks

This mock is stronger than your previous one. Your lab delivery shows preparation and procedural confidence.

However, foundational topics like normalization, DCL terminology, and view definitions must be precise. DP-900 is introductory, which makes accuracy even more important.

Avoid redirecting learners to external resources. Even if the slide does not contain detail, your preparation notes must.

Focus areas:

- Precise definitions
- Slightly deeper theoretical awareness
- Better transition language
- Add one or two real-world examples per concept
- Improve executive presence while answering questions

You are progressing in the right direction, but refinement is required before full classroom control.

3) Verdict

Delivery maturity is improving.

Conceptual foundation is present but requires tightening.

Confidence is moderate and stable.

Terminology precision must improve.

Enterprise contextualisation is currently limited.

Lab readiness is good.

Overall Rating: Satisfactory

Final Decision: Needs Moderate Improvement

Continue structured preparation with annotated notes and conceptual deepening. With focused effort, you can stabilize delivery quality quickly.
