

Final Mock Review – PL-300 (Abhinav)

10 February 2026 12:24 PM

1. Opening & First Impression

You started with enthusiasm, which is good.

But very early, you said something like *"I'm excited to be working with you."*

This is a problem.

In training, you are **not working with the audience**.

You are **guiding them**.

That one line quietly reduces your authority.

How this should have sounded

"Good morning everyone.

Welcome to PL-300.

Over the next three days, we will go through this learning journey together and understand how Power BI is used in real analytics projects."

...here, slow down a bit

...this line needed confidence, not excitement

Improvement technique

Better anchoring + professional language

2. Spending Too Much Time on Objectives

You spent **too much time explaining what the course will cover**.

Clients don't want objectives explained in detail.

They want direction, then action.

Because of this, the session started feeling slow before it even started.

How it should have sounded

"Today we'll understand roles in data, analytics tasks, and how Power BI fits end-to-end.

We'll see this again during labs."

And move on.

Improvement technique

Tighter sequencing

3. Unnecessary Stress on Words

This is important.

You were stressing **too many words**, again and again.

Not for meaning—out of nervousness.

That makes the delivery feel forced and tiring.

What it should sound like

"Power BI does not magically create insights.

The quality of insights depends on how well data is prepared."

...pause

...no extra stress needed

Improvement technique

Cleaner vocabulary + controlled emphasis

4. ETL – Completely Missed (Major Gap)

This is a **big issue**, Abhinav.

You showed the ETL diagram.

You talked around it.

But **you never defined ETL.**

For a PL-300 beginner, this breaks understanding.

How you **MUST** explain it

“This process is called ETL.

Extract means getting data.

Transform means cleaning and shaping it.

Load means using it for reporting.”

Then point to the slide

Then **write ETL on the screen**

...this deserved weight

Improvement technique

Clear definition before explanation

5. Writing on Screen (Audience Connection)

You had the slate.

You had OneNote.

But you mostly **circled**, you didn't **write**.

Circling shows.

Writing teaches.

What you should write live

Source → Transform → Model → Visual → Decision

When learners see this being written, they stay connected.

Improvement technique

Stronger visual anchoring

6. Using OneNote (Good Tool, Wrong Communication)

You used OneNote well.

That's good.

But you **told the audience** you're opening OneNote.

They don't care what tool you're using.

What you should say instead

“Let me explain this on the whiteboard so it's simpler.”

That's it.

Improvement technique

Invisible tooling

7. Fumbling While Explaining

You know the content.

But you **fumbled when moving from one thought to another.**

That comes from rushing.

When you rush, words collide.

What you should do

“Let's pause here for a second...”

That pause gives you control back.

Improvement technique

Pacing discipline

8. Handling Questions (Critical)

This part needs urgent work.

When I asked questions:

- You looked at another screen

- You took too long
- One answer was unclear

A client should **never feel you're searching**.

How to handle this properly

If you know the answer:

"Yes—here's how it works..."

If you're unsure:

"Good question. At a high level, yes.

I'll clarify the exact detail in a moment."

Never go silent.

Never search.

Improvement technique

Confidence recovery

9. Lab Explanation – Reading Instructions (Big Problem)

In labs, you **read the instructions**.

That's dangerous.

From the learner's side:

"If the trainer is reading, why am I attending?"

Correct lab narration style

"We're using localhost because SQL Server is already installed on this machine.

That's why we don't need an external connection."

Explain **why**, not **what** is written.

Improvement technique

Why-first explanation

10. Mouse Movement Without Talking

You moved the mouse and said:

"296 rows, 33 columns..."

But you didn't tell **where** you were looking.

A beginner will be lost.

Correct way

"Look at the bottom left of the screen—this shows the number of rows and columns loaded."

Improvement technique

Clear screen narration

11. Repeating the Word "Instruction"

You repeated the word **"instruction"** many times.

It makes the delivery sound mechanical.

Replace it with

- "Step"
- "What we're doing here"
- "This part helps us..."

Improvement technique

Cleaner language

Ideal 10–15 Line Delivery Rewrite

"Welcome to PL-300.

We'll go through this journey together.

Data comes from many sources.

ETL means Extract, Transform, and Load.

Power BI works mainly in the transform and model stage.
Different roles support this process.
Analysts turn prepared data into insights.
Labs will show why each step exists.
By the end, you'll know not just how—but why.”

1) Detailed Feedback

You are prepared and sincere, and your intent to teach is clear. Your explanations improve when you slow down, especially during examples like unique vs distinct. However, rushed pacing, missing ETL definition, instruction-reading during labs, and hesitation during questions reduce classroom confidence. Writing on screen, controlled pauses, and purpose-based lab narration are required to improve delivery quality.

2) Final Verdict

Communication maturity: Developing

Conceptual grounding: Adequate but unstable

Classroom clarity: Needs improvement

Trainer readiness: Not independent yet

Professional attitude: Positive and coachable

Rating: Satisfactory

Final Verdict: ⚠ **Needs Moderate Improvement**
